## Errors and approximations

## Error due to measurement:

الأخطاء والتقريبـات:
all problems in which the measurement of distance, time, mass or other quantities occurs, an exact answer cannot be given; only an answer that is correct to a stated degree of accuracy can be given.
To take account of measurement errors it is usual to limit answers so that the result given is not more than one significant figure greater than the least accurate number given in the data.

إن قياسات المسافات، الزمن، الكتل أو غيرها، محدودة الدقةة.
 ذات الدلالة تزيد برقم واحد عن عدد الأرقام ذات الدلالالة الأصغر في القياسات.

Problem 18. The area $A$ of a triangle is $A=\frac{1}{2} \times b \times h$. The base $b$ when measured is found to be 3.26 cm , and the perpendicular height $h$ is 7.5 cm . Determine the area of the triangle.
$A=\frac{1}{2} \times 3.26 \times 7.5=12.225 \mathrm{~cm}^{2}$ (by calculator) The approximate value is $\frac{1}{2} \times 3 \times 8=12 \mathrm{~cm}^{2}$ so there are no obvious blunder or magnitude errors. However, it is not usual in a measurement-type problem to state the answer to accuracy greater than 1 significant figure more than the least accurate number in the data; this is 7.5 cm , so the result should not have more than 3 significant figures.
Thus, area of triangle $=12.2 \mathbf{c m}^{2}$

## Rounding-off errors:

## Blunder errors

It is possible, through an incorrect procedure, to
 obtain the wrong answer to a calculation.

Order of magnitude error
It exist if incorrect positioning of the decimal point occurs after a calculation has been completed.

خطأ المرتبـة العشريـة: ويحصـل عندما تزاح الفاصبلة العشـريـة عن موقـهـا أثناء أو بـعـد اتمـام الحسـابـات.
