1.3 Trigonometric Functions

## Combining Functions; Shifting and Scaling Graphs

Like numbers, functions can be added, subtracted, multiplied, and divided (except where the denominator is zero) to produce new functions. If $f$ and $g$ are functions, then for every $x$ that belongs to the domains of both $f$ and $g$ (that is, for $x \in D_{f} \cap D_{g}$ ), we define functions $f+g, f-g$, and $f g$ by the formulas

$$
\begin{aligned}
(f+g)(x) & =f(x)+g(x) \\
(f-g)(x) & =f(x)-g(x) \\
(f g)(x) & =f(x) g(x) .
\end{aligned}
$$

At any point of $D_{f} \cap D_{g}$ at which $g(x) \neq 0$, we can also define the function $f>g$ by the formula

$$
\left(\frac{f}{g}\right)(x)=\frac{f(x)}{g(x)} \quad(\text { where } g(x) \neq 0)
$$

## Combining Functions; Shifting and Scaling Graphs

Functions can also be multiplied by constants: If $c$ is a real number, then the function $c f$ is defined for all $x$ in the domain of $f$ by

$$
(c f)(x)=c f(x)
$$

EXAMPLE 1 The functions defined by the formulas

$$
f(x)=\sqrt{x} \quad \text { and } \quad g(x)=\sqrt{1-x}
$$

have domains $D(f)=[0, \infty)$ and $D(g)=(-\infty, 1]$. The points common to these domains are the points in

$$
[0, \infty) \cap(-\infty, 1]=[0,1] .
$$

## Composite Functions

DEFINITION If $f$ and $g$ are functions, the composite function $f \circ g$ (" $f$ composed with $g "$ ) is defined by

$$
(f \circ g)(x)=f(g(x)) .
$$

The domain of $f \circ g$ consists of the numbers $x$ in the domain of $g$ for which $g(x)$ lies in the domain of $f$.

The functions $f \circ g$ and $g \circ f$ are usually quite different.

## Composite Functions

EXAMPLE 2 If $f(x)=\sqrt{x}$ and $g(x)=x+1$, find
(a) $(f \circ g)(x)$
(b) $(g \circ f)(x)$
(c) $(f \circ f)(x)$
(d) $(g \circ g)(x)$.

## Solution

## Composition

(a) $(f \circ g)(x)=f(g(x))=\sqrt{g(x)}=\sqrt{x+1}$
(b) $(g \circ f)(x)=g(f(x))=f(x)+1=\sqrt{x}+1$
(c) $(f \circ f)(x)=f(f(x))=\sqrt{f(x)}=\sqrt{\sqrt{x}}=x^{1 / 4}$
(d) $(g \circ g)(x)=g(g(x))=g(x)+1=(x+1)+1=x+2$

## Domain

$$
\begin{aligned}
& {[-1, \infty)} \\
& {[0, \infty)} \\
& {[0, \infty)}
\end{aligned}
$$

To see why the domain of $f \circ g$ is $[-1, \infty)$, notice that $g(x)=x+1$ is defined for all real $x$ but $g(x)$ belongs to the domain of $f$ only if $x+1 \geq 0$, that is to say, when $x \geq-1$.

Notice that if $f(x)=x^{2}$ and $g(x)=\sqrt{x}$, then $(f \circ g)(x)=(\sqrt{x})^{2}=x$. However, the domain of $f \circ g$ is $[0, \infty)$, not $(-\infty, \infty)$, since $\sqrt{x}$ requires $x \geq 0$.

## Shifting a Graph of a Function

## Shift Formulas

Vertical Shifts
$y=f(x)+k \quad$ Shifts the graph of $f u p k$ units if $k>0$
Shifts it down $|k|$ units if $k<0$

## Horizontal Shifts

$y=f(x+h) \quad$ Shifts the graph of $f$ left $h$ units if $h>0$
Shifts it right $|h|$ units if $h<0$

## Shifting a Graph of a Function

## EXAMPLE 3

(a) Adding 1 to the right-hand side of the formula $y=x^{2}$ to get $y=x^{2}+1$ shifts the graph up 1 unit (Figure 1.29).
(b) Adding -2 to the right-hand side of the formula $y=x^{2}$ to get $y=x^{2}-2$ shifts the graph down 2 units (Figure 1.29).

FIGURE 1.29 To shift the graph of $f(x)=x^{2}$ up (or down), we add positive (or negative) constants to the formula for $f$ (Examples 3a and b).

## Shifting a Graph of a Function

FIGURE 1.30 To shift the graph of $y=x^{2}$ to the left, we add a positive constant to $x$ (Example 3c). To shift the graph to the right, we add a negative constant to $x$.

## Shifting a Graph of a Function

FIGURE 1.31 Shifting the graph of $y=|x| 2$ units to the right and 1 unit down (Example 3d).

## Scaling and Reflecting a Graph of a Function

To scale the graph of a function $y=f(x)$ is to stretch or compress it, vertically or horizontally. This is accomplished by multiplying the function $f$, or the independent variable $x$, by an appropriate constant $c$.
Reflections across the coordinate axes are special cases where $c=-1$

## Vertical and Horizontal Scaling and Reflecting Formulas

For $c>1$, the graph is scaled:
$y=c f(x) \quad$ Stretches the graph of $f$ vertically by a factor of $c$.
$y=\frac{1}{c} f(x) \quad$ Compresses the graph of $f$ vertically by a factor of $c$.
$y=f(c x) \quad$ Compresses the graph of $f$ horizontally by a factor of $c$.
$y=f(x / c) \quad$ Stretches the graph of $f$ horizontally by a factor of $c$.
For $c=-1$, the graph is reflected:
$y=-f(x) \quad$ Reflects the graph of $f$ across the $x$-axis.
$y=f(-x) \quad$ Reflects the graph of $f$ across the $y$-axis.

## Trigonometric Functions

## Angles

Angles are measured in degrees or radians. The number of radians in the central angle $A^{\prime} C B^{\prime}$ within a circle of radius $r$ is defined as the number of "radius units" contained in the arc $s$ subtended by that central angle. If we denote this central angle by $\theta$ when measured in radians, this means that $\theta=s / r$ (Figure 1.36), or

$$
\begin{equation*}
s=r \theta \quad(\theta \text { in radians }) \tag{1}
\end{equation*}
$$

$$
\begin{equation*}
\pi \text { radians }=180^{\circ} \tag{2}
\end{equation*}
$$

and
1 radian $=\frac{180}{\pi}(\approx 57.3)$ degrees $\quad$ or $\quad 1$ degree $=\frac{\pi}{180}(\approx 0.017)$ radians.

## Periodicity and Graphs of the Trigonometric Functions

DEFINITION A function $f(x)$ is periodic if there is a positive number $p$ such that $f(x+p)=f(x)$ for every value of $x$. The smallest such value of $p$ is the period of $f$.

## Periods of Trigonometric Functions

Period $\pi$ : $\quad \tan (x+\pi)=\tan x$

$$
\cot (x+\pi)=\cot x
$$

Period 2 $\pi$ : $\quad \sin (x+2 \pi)=\sin x$

$$
\begin{aligned}
& \cos (x+2 \pi)=\cos x \\
& \sec (x+2 \pi)=\sec x \\
& \csc (x+2 \pi)=\csc x
\end{aligned}
$$
