**3.1 Antiderivatives**

**3.2 Indefinite Integrals**

**3.3 Integration by Parts**

More generally, starting with a function  $f$ , we want to find a function  $F$  whose derivative is  $f$ . If such a function  $F$  exists, it is called an *antiderivative* of  $f$ . Antiderivatives are the link connecting the two major elements of calculus: derivatives and definite integrals.

## Finding Antiderivatives

**DEFINITION** A function  $F$  is an **antiderivative** of  $f$  on an interval  $I$  if  $F'(x) = f(x)$  for all  $x$  in  $I$ .

**EXAMPLE 1** Find an antiderivative for each of the following functions.

(a)  $f(x) = 2x$       (b)  $g(x) = \cos x$       (c)  $h(x) = \frac{1}{x} + 2e^{2x}$

**Solution** We need to think backward here: What function do we know has a derivative equal to the given function?

(a)  $F(x) = x^2$       (b)  $G(x) = \sin x$       (c)  $H(x) = \ln |x| + e^{2x}$

Each answer can be checked by differentiating. The derivative of  $F(x) = x^2$  is  $2x$ . The derivative of  $G(x) = \sin x$  is  $\cos x$ , and the derivative of  $H(x) = \ln |x| + e^{2x}$  is  $(1/x) + 2e^{2x}$ . ■

The function  $F(x) = x^2$  is not the only function whose derivative is  $2x$ . The function  $x^2 + 1$  has the same derivative. So does  $x^2 + C$  for any constant  $C$ . Are there others?

**THEOREM 8** If  $F$  is an antiderivative of  $f$  on an interval  $I$ , then the most general antiderivative of  $f$  on  $I$  is

$$F(x) + C$$

where  $C$  is an arbitrary constant.

**EXAMPLE 2** Find an antiderivative of  $f(x) = 3x^2$  that satisfies  $F(1) = -1$ .

**Solution** Since the derivative of  $x^3$  is  $3x^2$ , the general antiderivative

$$F(x) = x^3 + C$$

gives all the antiderivatives of  $f(x)$ . The condition  $F(1) = -1$  determines a specific value for  $C$ . Substituting  $x = 1$  into  $F(x) = x^3 + C$  gives

$$F(1) = (1)^3 + C = 1 + C.$$

Since  $F(1) = -1$ , solving  $1 + C = -1$  for  $C$  gives  $C = -2$ . So

$$F(x) = x^3 - 2$$

# Antiderivatives

**EXAMPLE 2** Find an antiderivative of  $f(x) = 3x^2$  that satisfies  $F(1) = -1$ .

**Solution** Since the derivative of  $x^3$  is  $3x^2$ , the general antiderivative

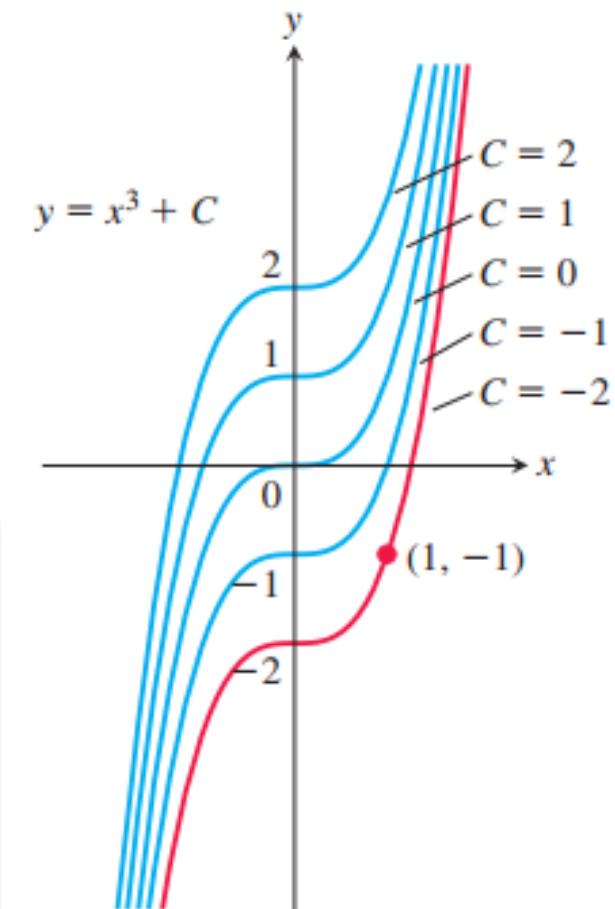

$$F(x) = x^3 + C$$

gives all the antiderivatives of  $f(x)$ . The condition  $F(1) = -1$  determines a specific value for  $C$ . Substituting  $x = 1$  into  $F(x) = x^3 + C$  gives

$$F(1) = (1)^3 + C = 1 + C.$$

Since  $F(1) = -1$ , solving  $1 + C = -1$  for  $C$  gives  $C = -2$ . So

$$F(x) = x^3 - 2$$

## EXAMPLE 3

Find the general antiderivative of each of the following functions.

(a)  $f(x) = x^5$

(b)  $g(x) = \frac{1}{\sqrt{x}}$

(c)  $h(x) = \sin 2x$

(d)  $i(x) = \cos \frac{x}{2}$

(e)  $j(x) = e^{-3x}$

(f)  $k(x) = 2^x$

# Antiderivatives

**Solution** In each case, we can use one of the formulas listed in Table 4.2.

(a)  $F(x) = \frac{x^6}{6} + C$

Formula 1  
with  $n = 5$

(b)  $g(x) = x^{-1/2}$ , so

$$G(x) = \frac{x^{1/2}}{1/2} + C = 2\sqrt{x} + C$$

Formula 1  
with  $n = -1/2$

(c)  $H(x) = \frac{-\cos 2x}{2} + C$

Formula 2  
with  $k = 2$

(d)  $I(x) = \frac{\sin(x/2)}{1/2} + C = 2\sin\frac{x}{2} + C$

Formula 3  
with  $k = 1/2$

(e)  $J(x) = -\frac{1}{3}e^{-3x} + C$

Formula 8  
with  $k = -3$

(f)  $K(x) = \left(\frac{1}{\ln 2}\right)2^x + C$

Formula 13  
with  $a = 2, k = 1$

3. <i>Sum or Difference Rule:</i>	$f(x) \pm g(x)$	$F(x) \pm G(x) + C$

**EXAMPLE 4** Find the general antiderivative of

$$f(x) = \frac{3}{\sqrt{x}} + \sin 2x.$$

# Antiderivatives

$$\begin{aligned}F(x) &= 3G(x) + H(x) + C \\&= 6\sqrt{x} - \frac{1}{2}\cos 2x + C\end{aligned}$$

## Indefinite Integrals

A special symbol is used to denote the collection of all antiderivatives of a function  $f$ .

**DEFINITION** The collection of all antiderivatives of  $f$  is called the **indefinite integral** of  $f$  with respect to  $x$ , and is denoted by

$$\int f(x) dx.$$

The symbol  $\int$  is an **integral sign**. The function  $f$  is the **integrand** of the integral, and  $x$  is the **variable of integration**.

# Indefinite Integrals

$$\int 2x \, dx = x^2 + C,$$

$$\int \cos x \, dx = \sin x + C,$$

$$\int \left( \sec^2 x + \frac{1}{2\sqrt{x}} \right) dx = \tan x + \sqrt{x} + C$$

## EXAMPLE 6

Evaluate

$$\int (x^2 - 2x + 5) \, dx.$$

# Indefinite Integrals

**Solution** If we recognize that  $(x^3/3) - x^2 + 5x$  is an antiderivative of  $x^2 - 2x + 5$ , we can evaluate the integral as

$$\int (x^2 - 2x + 5) dx = \underbrace{\frac{x^3}{3} - x^2 + 5x}_{\text{antiderivative}} + \underbrace{C}_{\text{arbitrary constant}}$$

If we do not recognize the antiderivative right away, we can generate it term-by-term with the Sum, Difference, and Constant Multiple Rules:

$$\begin{aligned}\int (x^2 - 2x + 5) dx &= \int x^2 dx - \int 2x dx + \int 5 dx \\&= \int x^2 dx - 2 \int x dx + 5 \int 1 dx \\&= \left( \frac{x^3}{3} + C_1 \right) - 2 \left( \frac{x^2}{2} + C_2 \right) + 5(x + C_3) \\&= \frac{x^3}{3} + C_1 - x^2 - 2C_2 + 5x + 5C_3.\end{aligned}$$

# Indefinite Integrals

$$\begin{aligned}\int (x^2 - 2x + 5) dx &= \int x^2 dx - \int 2x dx + \int 5 dx \\ &= \frac{x^3}{3} - x^2 + 5x + C.\end{aligned}$$

# Integration by Parts

## Integration by Parts Formula

$$\int u \, dv = uv - \int v \, du \quad (2)$$

**EXAMPLE 1** Find

$$\int x \cos x \, dx.$$

**Solution** We use the formula  $\int u \, dv = uv - \int v \, du$  with

$$\begin{aligned} u &= x, & dv &= \cos x \, dx, \\ du &= dx, & v &= \sin x. \end{aligned} \quad \text{Simplest antiderivative of } \cos x$$

Then

$$\int x \cos x \, dx = x \sin x - \int \sin x \, dx = x \sin x + \cos x + C. \quad \blacksquare$$

# Integration by Parts

**EXAMPLE 2** Find  $\int \ln x \, dx$ .

## Solution

$$u(x) = \ln x \quad \text{and} \quad v'(x) = 1.$$

We differentiate  $u(x)$  and find an antiderivative of  $v'(x)$ ,

$$u'(x) = \frac{1}{x} \quad \text{and} \quad v(x) = x.$$

Then

$$\begin{aligned} \int \ln x \cdot 1 \, dx &= (\ln x) x - \int x \frac{1}{x} \, dx && \text{Integration by parts formula} \\ &\quad \begin{array}{c} | \\ u(x) \end{array} \quad \begin{array}{c} | \\ v'(x) \end{array} && \begin{array}{c} | \\ u(x) \end{array} \quad \begin{array}{c} | \\ v(x) \end{array} && \begin{array}{c} | \\ v(x) \end{array} \quad \begin{array}{c} \diagdown \\ u'(x) \end{array} \\ &&&&& \end{array} \\ &= x \ln x - x + C && \text{Simplify and integrate.} \end{aligned}$$

# Integration by Parts

## EXAMPLE 3 Evaluate

$$\int x^2 e^x dx.$$

**Solution** We use the integration by parts formula Equation (1) with

$$u(x) = x^2 \quad \text{and} \quad v'(x) = e^x.$$

We differentiate  $u(x)$  and find an antiderivative of  $v'(x)$ ,

$$u'(x) = 2x \quad \text{and} \quad v(x) = e^x.$$

We summarize this choice by setting  $du = u'(x) dx$  and  $dv = v'(x) dx$ , so

$$du = 2x dx \quad \text{and} \quad dv = e^x dx.$$

We then have

$$\int x^2 e^x dx = \underbrace{x^2 e^x}_{\begin{array}{c} | \\ u \\ | \\ dv \end{array}} - \int \underbrace{e^x 2x dx}_{\begin{array}{c} | \\ v \\ | \\ du \end{array}} \quad \text{Integration by parts formula}$$

# Integration by Parts

$u = x, dv = e^x dx$ . Then  $du = dx, v = e^x$ , and

$$\int \underbrace{xe^x}_{u \quad dv} dx = \underbrace{xe^x}_{u \quad v} - \int \underbrace{e^x}_{v \quad du} dx = xe^x - e^x + C.$$

Integration by parts Equation (2)

$$u = x, dv = e^x dx$$

$$v = e^x, \quad du = dx$$

Using this last evaluation, we then obtain

$$\begin{aligned}\int x^2 e^x dx &= x^2 e^x - 2 \int x e^x dx \\ &= x^2 e^x - 2 x e^x + 2 e^x + C,\end{aligned}$$

where the constant of integration is renamed after substituting for the integral on the right.

# Integration by Parts

## EXAMPLE 4      Evaluate

$$\int e^x \cos x \, dx.$$

**Solution** Let  $u = e^x$  and  $dv = \cos x \, dx$ . Then  $du = e^x \, dx$ ,  $v = \sin x$ , and

$$\int e^x \cos x \, dx = e^x \sin x - \int e^x \sin x \, dx. \quad u(x) = e^x, \quad v(x) = \sin x$$

The second integral is like the first except that it has  $\sin x$  in place of  $\cos x$ . To evaluate it, we use integration by parts with

$$u = e^x, \quad dv = \sin x \, dx, \quad v = -\cos x, \quad du = e^x \, dx.$$

# Integration by Parts

Then

$$\begin{aligned}\int e^x \cos x \, dx &= e^x \sin x - \left( -e^x \cos x - \int (-\cos x)(e^x \, dx) \right) \quad u(x) = e^x, \quad v(x) = -\cos x \\ &= e^x \sin x + e^x \cos x - \int e^x \cos x \, dx.\end{aligned}$$

The unknown integral now appears on both sides of the equation, but with opposite signs. Adding the integral to both sides and adding the constant of integration give

$$2 \int e^x \cos x \, dx = e^x \sin x + e^x \cos x + C_1.$$

Dividing by 2 and renaming the constant of integration give

$$\int e^x \cos x \, dx = \frac{e^x \sin x + e^x \cos x}{2} + C.$$

# Integration by Parts

**EXAMPLE 5** Obtain a formula that expresses the integral

$$\int \cos^n x \, dx$$

**Solution** We may think of  $\cos^n x$  as  $\cos^{n-1} x \cdot \cos x$ . Then we let

$$u = \cos^{n-1} x \quad \text{and} \quad dv = \cos x \, dx,$$

so that

$$du = (n - 1) \cos^{n-2} x (-\sin x \, dx) \quad \text{and} \quad v = \sin x.$$

Integration by parts then gives

$$\begin{aligned}\int \cos^n x \, dx &= \cos^{n-1} x \sin x + (n - 1) \int \sin^2 x \cos^{n-2} x \, dx \\&= \cos^{n-1} x \sin x + (n - 1) \int (1 - \cos^2 x) \cos^{n-2} x \, dx \\&= \cos^{n-1} x \sin x + (n - 1) \int \cos^{n-2} x \, dx - (n - 1) \int \cos^n x \, dx.\end{aligned}$$

# Integration by Parts

If we add

$$(n - 1) \int \cos^n x \, dx$$

to both sides of this equation, we obtain

$$n \int \cos^n x \, dx = \cos^{n-1} x \sin x + (n - 1) \int \cos^{n-2} x \, dx.$$

We then divide through by  $n$ , and the final result is

$$\int \cos^n x \, dx = \frac{\cos^{n-1} x \sin x}{n} + \frac{n-1}{n} \int \cos^{n-2} x \, dx.$$

$$\begin{aligned}\int \cos^3 x \, dx &= \frac{\cos^2 x \sin x}{3} + \frac{2}{3} \int \cos x \, dx \\ &= \frac{1}{3} \cos^2 x \sin x + \frac{2}{3} \sin x + C.\end{aligned}$$
